Sprint 2 report Elouan Besnier, 40311078

Sprint objective: During this sprint, our team implemented a large portion of the essential basic features for CareerConnect to be usable. The planned outcome was to have the ability to create, modify and delete job postings, create job searching and filtering as well as having a new home page and UI for all the above features.

Feature and functionality: After this sprint, it is now possible to

As a job seeker:

- Search for job postings
- Apply to job postings
- See all the job posting applications that are pending

As a recruiter:

- Creating new job posting
- See all job posted
- Modify and delete job postings
- See applicants for each job posting
- Download the resume of the applicant

What makes our project unique: We have ideas of implementing a tags system to make searching easier, we plan on creating a third User type called company, which would group recruiters under a same banner and certify them. We also plan to implement an automatic cover letter creation through ai with the help of resume and job posting. Currently, the only thing differentiating us from other teams is the style of our page that we are trying to reinforce and maintain across all pages. We have plan of creating specific css style file to store header, footer and button style, making reusability easier.

Challenge and resolution: The main challenge during this sprint was to learn how to work in parallel and the difficulty of bringing everything back together. We had split the tasks into 5, but some people relied on others' work to develop their features. Since we are developing the core of the app, there are more difficulty merging all the implementation since everyone's implementation is slightly different and sometime overlap. We have solved it by spending some time in meetings discussing our implementation and creating partial merging branch, where we could bring 2 features together, allowing us to merge everyones work 1 by one.

Team contribution: Everyone worked on their assigned task. Rabih took care of the meeting minutes, and I managed the product backlog to ensure all the basic pieces were more inline with scrum. I also took care of leading the meetings.
